Claude Skills Hands-On Session

Rajesh Pentakota

Founder, CodePup AI (https://www.linkedin.com/in/rajeshpeko/)

Ex-Product Manager at Zynga, Flipkart, Walmart

Clone Website Skill

A Claude Code skill that produces a pixel-perfect clone of any live website — so close the original owner couldn't tell the difference. Built for Product Managers who need working, editable codebases without manual design handoffs.

CLAUDE CODE SKILL | 5-PHASE PIPELINE | FOR PRODUCT MANAGERS

What is the Clone Website Skill?

The One-Liner

Turn any reference URL into a working, editable codebase in a single pass — no manual design handoff, no "close enough" approximations. Extract everything first, build from real data, validate against the original.

When to Use It

"Clone this site" · "Replicate this page" · "Copy this design" · Competitor teardowns · Design inspiration starters

Why It Matters for PMs

→ Zero Design Handoff

No back-and-forth with designers to translate a reference site into specs.

→ Real Fidelity

Not "inspired by" — exact colours, spacing, fonts, and interactions pulled directly from the live DOM.

→ One-Pass Output

A fully editable codebase ready for redesign, competitor analysis, or rapid prototyping.

The 5-Phase Workflow

A strict, ordered pipeline — each phase must complete before the next begins. **Measure twice, cut once.** No guessing, no eyeballing.

1. Recon

Capture everything from the live site

2. Design Doc

Write down exactly what was found

3. Build

Code the clone using exact values

4. Validate

Compare clone vs. original side-by-side

5. Responsive

Make it work on tablet & mobile

Mental model: This is a disciplined engineering pipeline, not a creative approximation exercise. Every phase produces a verifiable artefact before the next phase is unlocked.

Phase 1: Recon — The Secret Sauce

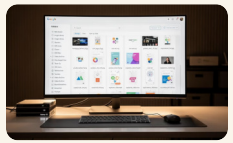
This is where **80% of the quality** comes from. All recon is performed via Chrome DevTools MCP at a fixed **1440×900 viewport**, producing a `clone-ref/` folder that becomes the single source of truth for every subsequent phase.

Screenshots

Full-page capture plus section-by-section shots scrolled in 900px chunks — nothing is missed.

Design Tokens

Real colours, spacing values, font families, border radii, and shadows extracted directly from the live DOM.



Asset Inventory

Every image, SVG, video, and Lottie URL catalogued and reused directly — never recreated from scratch.

Responsive Snapshots

Additional captures at 1024px (tablet) and 390px (mobile) to inform the final responsive pass.

Extraction scripts also capture **HTML structure** per section, **Google Font substitutes**, all **interactions** (hover, focus, dropdowns, tabs), and explicit **animation data** — or confirmation that none exist.

Design Tokens: The Foundation of Fidelity

Design tokens are the visual atoms of your user interface — named entities that store design decisions, like colour values, font families, and spacing measurements. They create a single source of truth for design language, ensuring consistency and efficiency across all platforms and components.

Colours

Defines primary, secondary, accent, and semantic colours. For example, `--color-brand-primary: #3371A5;`

Typography

Includes font families, weights, sizes, and line heights for all text elements. E.g., `--font-body: 'Inter', sans-serif;`

Spacing & Sizing

Standardised values for padding, margins, and component dimensions. E.g., `--spacing-md: 16px;`

Borders & Shadows

Consistent border radii, widths, styles, and shadow effects to maintain visual hierarchy. E.g., `--border-radius-sm: 4px;`

By capturing these values directly from the live DOM during Recon, the Clone Skill generates an editable codebase that reflects the original design with pixel-perfect accuracy.

NEW COHORT

AI Coding for Product Managers

Build Real Products in 6 Weeks

- 📅 **Cohort Starts:** May 3rd Week
- ⏱️ **Duration:** 6 Weeks
- 👨‍🏫 **Instructor:** Rajesh P
- 🔗 **Platform:** Maven
- PROMO CODE: CODEPUP50 (50% OFF)

Go from idea to shipped product using AI — no prior coding required.

Phases 2–4: Design → Build → Validate

PHASE 2

Design Document

A structured `design.md` covering **12 categories** — every detail from layout grid to micro-interaction. Crucially, it counts every repeating element precisely: *"6 pricing cards"*, not *"a few"*. Ambiguity is eliminated before a single line of code is written.

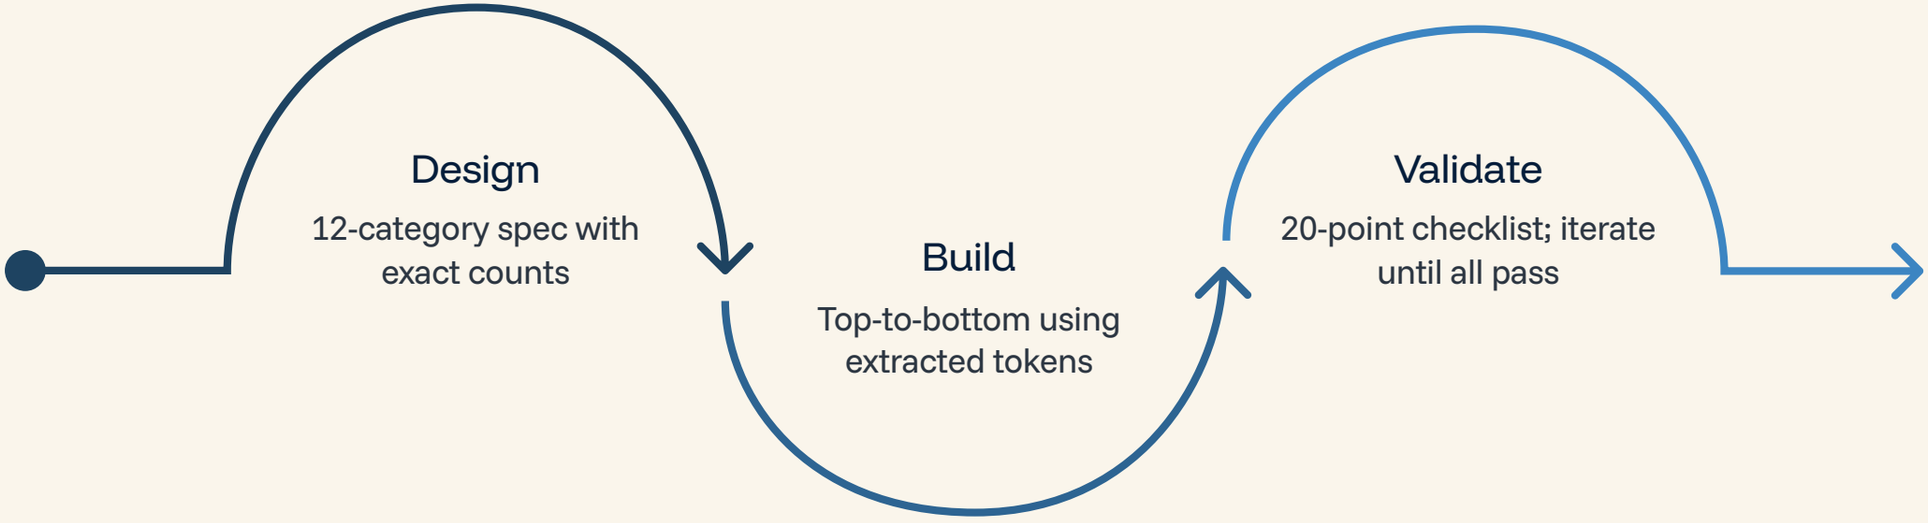
Build

The design system is set up from extracted tokens first. Sections are built **top-to-bottom** using exact values — no approximating, no placeholder colours. All assets link directly to the original URLs. The clone is built against data, not memory.

PHASE 4

Validate

Original and clone open in **two browser tabs** simultaneously. A validation script runs on both. Results are checked against a **20-point checklist**. Any failure triggers a fix loop — the standard is "everything passes", not "good enough".



Why It Works — What PMs Should Know

The Non-Negotiable Rules

Extract Before Build

No coding from screenshots alone — real DOM data drives every decision.

Real Values Only

Colours, padding, and fonts come straight from the live site. Zero estimation.

Full Content Fidelity

N items on the original = N items on the clone. No collapsing, no truncation.

Observe Animations

Every interaction is explicitly confirmed — never assumed to be absent.

What PMs Get Out of It

Reliable & Repeatable

Not "vibes-based" replication — the same pipeline produces the same quality every time.

Perfect Starting Point

Ideal for redesigns, competitor analysis, or rapid prototyping with a real foundation.

Built-In Design Spec

The `clone-ref/` folder + `design.md` doubles as a reusable design spec for your entire team.

Bottom line: It's a disciplined pipeline, not a magic trick — and that's exactly why the output is consistent every single time.
